

Phoenix Token (PXT)

WHITEPAPER

Version 1.0 · 07 September 2026

This document describes Phoenix Token as deployed on Base. The protocol source is [phoenix-protocol](#) on GitHub.

1. Abstract

Phoenix Token (PXT) is the utility token of the Phoenix Project. It is the currency of that economy: members participate through **Participation Shares**, and the value those shares produce is settled in PXT.

The token lives on Base as a standard ERC-20. The total supply is fixed. Members receive PXT in the project backoffice (rewards, staking, referrals, prizes) and can move it to an external wallet, send it to another person, or buy more of it against USDC on the official Uniswap pool. DEX sales are locked until **1 March 2027**; buys and wallet transfers work before that date.

2. Utility

The Phoenix Project is built around a shared production pool. The unit of membership in that pool is the **Participation Share**. A share is not a second token on the blockchain. It is the project's measure of participation: rent or renew a share, and the backoffice records daily production against it.

PXT is what that production becomes when it leaves the internal ledgers. The official presentation prices share rewards in USD for accounting, then converts them to PXT at the market rate when a member moves value to their main wallet, to staking, or to an external wallet. In that sense PXT is the settlement currency of the project: one asset that can sit in the backoffice, in a personal wallet, or in the public USDC pool.

That is the token's main utility:

- **Membership settlement.** Daily production on a Participation Share is credited to Rewards, Vouchers, and Staking. When those balances are paid out, the member receives PXT, not a separate project coin.
- **External value.** Once PXT is in an external wallet it has a market price against USDC. The presentation states that this price is what the backoffice uses for conversions and what the member sees in USD terms on the wallet.

- **Transfer inside the community.** PXT can be sent wallet to wallet. Until pool sales unlock, that peer-to-peer path is also the way a holder can exit to another person.
- **Entry from outside.** Deposits in ETH, WETH, USDC, or USDT on Base are described as buying PXT on Uniswap and crediting the member's main wallet. Buying on the official pool is the public way to obtain the same currency the backoffice already uses.
- **Long-horizon design.** Fees on buys, sells, and transfers fund donations, marketing, burn, and buyback. A sell lock until 1 March 2027 keeps the pool one-way (buys open, sales closed) while the membership economy is filling. None of that changes the role of PXT: it remains the unit members hold when they take production out of the platform.

Base is the chain where this currency was issued and where the official PXT/USDC pool, the fee wallets, and the backoffice connection went live (6 September 2026). Wallets that support Base can hold PXT like any other ERC-20.

PXT is not a share certificate and does not, by itself, create a Participation Share. Shares are rented and renewed in the backoffice. PXT is the token those shares pay in, and the token the rest of the project economy is counted in.

3. Token specification

Field	Value
Name	Phoenix Token
Symbol	PXT
Type	Utility token (ERC-20)
Decimals	6
Total supply	40,021,000,000,000 PXT (fixed)
Network	Base
Token contract	0xD0Ae953BE8E2E41406D3d5fE8b191441C2277B19
Paired with	USDC 0x833589fCD6eDb6E08f4c7C32D4f71b54bdA02913

The full supply was created at launch. Donation and marketing addresses cannot be changed. Contract ownership has been renounced.

4. How the token is traded

Users swap through the official Uniswap v4 PXT/USDC pool. A Phoenix hook on that pool applies buy and sell fees. Collected USDC goes to a fee collector, which pays

donations and marketing, burns PXT when required, and can buy PXT back into the pool.

Contract	Address
PXT	0xD0Ae953BE8E2E41406D3d5fE8b191441C2277B19
Trading hook	0xa36587Df6533adafA569e4EEeA326C6FbDECCcC
Fee collector	0xe8dE2fF2e6b45dE1159456fe42385C0958d2F635
Donation wallet	0xD7BD1df941F8f30b58179760Cf3323D018913E2b
Marketing wallet	0x7778B93a64B09295d890614eD8d4E61845899559
Official pool	0x00598d622684c5bf9b2d09fa84bf159c118d5538d990bd6baa2f32fc0e07f34f

The hook works only with this pool. Seed liquidity is in place. Ownership of the hook and fee collector has been renounced.

5. Fees

5.1 Wallet transfers

Sending PXT from one wallet to another takes a **2.7%** fee, unless the **recipient** is marked fee-exempt or no-penalty:

Destination	Share
Donation wallet	1.45%
Marketing wallet	1.25%
Recipient	97.3%

The sender's status does not skip this fee. Transfers that are part of a DEX buy, a liquidity exit, or a protocol payout do not pay it.

5.2 DEX buys and sells

The Uniswap pool itself does not charge an LP fee. Phoenix fees are applied on the swap:

Kind	Total	Split
Buy	2.7%	1.45% donations · 1.25% marketing

Sell (up to 10% of the wallet in 24 hours)	5.4%	1.25% donations · 1.15% marketing · 1.85% burn · 1.15% buyback
Penalty (more than 10% of the wallet in 24 hours)	37.8%	1.25% donations · 1.15% marketing · 1.85% burn · 33.55% buyback

Buy and transfer use the same 1.45% / 1.25% split. On a sell or penalty trade, **1.85% of the PXT sold is burned**. The other legs are taken in **USDC**. Protocol buybacks do not pay the buy fee again.

5.3 Dump window

Selling more than **10%** of a wallet's balance within **24 hours** uses the penalty fee.

Wallets marked **no-penalty** do not pay the 2.7% transfer tax when they receive PXT. Their DEX sells always pay the base 5.4% and never the dump penalty.

Wallets marked **fee-exempt** get the USDC sell fee refunded; the 1.85% burn still applies. Ordinary buys still pay 2.7%. Fee-exempt status does not bypass the sell lock or the anti-bot opening.

6. Protections

6.1 Sell lock

DEX sells are locked until **1 March 2027, 00:00 UTC**. That date is fixed in the contract and cannot be changed. Before then, selling PXT on the pool is not possible. Sending PXT to another wallet and buying on the pool still work.

Until unlock, the official presentation says holders who want to exit may sell peer-to-peer (wallet to wallet, 2.7% transfer fee). That is not a pool sale.

6.2 Anti-bot

After the unlock date, public pool sells stay closed until a designated first seller opens them with a first sale. Until that happens, other wallets cannot sell on the pool. That opening has not been completed yet.

6.3 Liquidity

Official-pool **seed liquidity is locked**. It was minted once into a position owned by the protocol fee collector. That contract has no withdraw, and its ownership is renounced, so the seed cannot be pulled.

Until **1 March 2027** the hook also blocks any other address from *adding* liquidity on that pool. Protocol addLiquidity itself is one-shot and already used; buyback

recycle LP is minted only after selling is open, still on the collector, and is not withdrawn.

After unlock, other wallets may add **their own** liquidity (and can remove only what they added). That does not unlock or move the seed.

6.4 Transfers to contracts

Sending PXT to an ordinary wallet is allowed (fees still apply). Sending PXT to a smart contract (for example staking or a bridge) is allowed only if that contract has been approved. After ownership was renounced, a designated approver can add or remove those contracts. This is not a pause on user-to-user transfers.

7. Buyback

USDC fees go to the fee collector.

Anyone can trigger payout of pending donations, marketing, and burns. Buyback — using reserved USDC to buy PXT and return it to the pool as liquidity — can be run only by authorized operators. Buyback price protection is a **2%** cap against the previous block's pool price. That cap is fixed.

8. Supply

No new PXT can be created after launch. Tokens can be burned by their holder.

The official presentation states that **main supply is controlled by the backoffice** and is released only in four cases:

1. Rewards moved to the main wallet (1st and 15th of each month in phase one), converted from USD to PXT at the market price.
2. Monthly staking of the stake balance (first order stated as 30 September 2026).
3. Assigning Participation Shares to a referral (voucher spend converted to PXT at market).
4. Lottery prizes (USD prize converted to PXT).

Those releases are backoffice operations, not automatic token rules.

The presentation also describes **planned burns**. They are not scheduled by the token contract. They happen only if the holder of those tokens burns them:

Trigger (as stated in the presentation)	Amount
Price reaches 0.0001 USD	20,000,000,000,000 PXT
Price reaches 0.001 USD	10,000,000,000,000 PXT
Price reaches 0.01 USD	5,000,000,000,000 PXT
30 August 2027	first of three annual burns
30 August 2028	second annual burn

30 August 2029

third annual burn

Circulating supply is total supply minus burned tokens minus tokens still held in uncirculated operational wallets. This paper does not publish a circulating figure.

9. Operational phases

The on-chain change is the sell unlock on 1 March 2027.

The official presentation describes two platform phases.

Phase one (1 June 2026 – 28 February 2027). The token was connected to the backoffice on **6 September 2026**. Each Participation Share accrues **0.50 USD per day** into three balances (converted to PXT at market when moved):

Balance	Use
Rewards	Move to the main wallet on the 1st and 15th; then to an external wallet or reinvest. Daily external withdrawals are capped at PXT worth 500 USD (regular) or 750 USD (VIP).
Vouchers	Pay sponsored shares for referrals. Unused voucher balance is forfeited at month end.
Staking	At month end, moved to a centralized staking pool for 365 days at 4% annual interest.

Phase-one revenue, as stated in the presentation, comes from acquiring liquidity for PXT.

Phase two (from 1 March 2027, the same day sells unlock). The backoffice uses Rewards and Staking. Daily reward per share is stated as 1.2% of the share's investment value (rewards) and 0.5% in PXT (staking), converted at the PXT/USDC rate. Reward balances are stated to hold USDC once selling is open. Vouchers become optional spend from the reward balance.

10. Participation Shares

The following is the membership model from the official presentation. It is not a token on the blockchain.

- Unit: **Participation Share**.
- First rent: **25 USD**, activation within 24 hours, **89 days** of production.
- Renewal: **20 USD**, instant activation, **90 days** of production.
- Maximum **2,000** shares per account.

- Annual **maintenance fee: 20 USD** (mandatory), for servers, hosting, staff, and development as stated in the presentation.
- **VIP** is optional (30 USD / 1 month, 150 USD / 6 months, 300 USD / 1 year). VIP raises the daily withdrawal cap and changes voucher and renewal rules as in the presentation.
- Affiliate: **1 USD** to the sponsor's reward balance per new or renewed share of a **direct** member, after maintenance is paid.
- A sponsor may assign 5-20 shares as a welcome gift, paid from voucher balance.

Deposits described in the presentation are sent on **Base** (ETH, WETH, USDC, or USDT). The presentation states those funds buy PXT on Uniswap and, after review, credit the main wallet minus the 2.7% buy fee.
